

Abstract

A flat-panel display unit is provided which includes: a PDP 10; an aluminum chassis 2 that is attached to the PDP 10; an upper data driver substrate 6 and a signal processing substrate 7 that are attached to the aluminum chassis 2; and a flexible cable 8 that connects the substrates 6, 7 electrically. Between the substrates 6, 7, a pressing plate 9 fixes at least one part of the flexible cable 8, so that the space between the flexible cable 8 and the aluminum chassis 2 remains unchanged. Thereby, a stray capacitor can be stably formed using the insulating material of the flexible cable 8, and a high-frequency noise can be effectively reduced.
